Art Unit: 2161

DETAILED ACTION

1. This action is issued in response to applicant's amendment filed June 01, 2010.

2. Claims 15-19 and 21-29 are presented. Claims 31-32 are added and claims 1-14,

20, and 30 are cancelled.

Claims 15-19, 21-29, and 31-32 are pending.

4. Applicant's arguments filed December 17, 2010, have been fully considered but

they are not persuasive.

Continued Examination Under 37 CFR 1.114

5. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on December 17, 2010 has been entered.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the

Art Unit: 2161

invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

 Claims 15-19 and 21-29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kalva (US Patent No. 7,149,770) filed January 29, 1999, in view of Liang (US Patent No. 6,766,355) filed October 21, 1998.

Regarding Claim 15, Kalva discloses a method for managing interactions between at least one peripheral command device and a terminal comprising at least one multimedia application exploiting the standard MPEG-4 for displaying a scene comprising MPEG-4 objects, said peripheral command device delivering to the terminal digital signals of user interactions as a function of actions of one or more users on said scene comprising:

constructing a first digital sequence having the form of a BIFS node (Binary Form for Scenes in accordance with the standard MPEG-4) (column 4, lines 17-22 and column 5, lines 15-32, Kalva), wherein the first digital sequence is based on an interaction stream of raw data from the peripheral command device to the terminal (column 4, lines 17-22, Kalva)¹ and wherein the BIFS node further comprises at least a nature of action field and a parameter for action field to be applied to objects of said scene, said node specifying an association between said digital signals of user interactions and the scene objects (column 4, lines 45-50; column 5, lines 19-52; Kalva), and

¹ Examiner Notes: Further details can be found within Kalva @ col.1, lines 30-36 and col.2, lines 49-60.

Art Unit: 2161

wherein the nature of action field defines at least one action to be applied to the scene with the parameter of action field, a value of the parameter for action field corresponds to a parameter of said digital signals received from the peripheral command device (columns 7-8, lines 18-25, 67, and 1-15, respectively, Kalva). However, Kalva is not as detailed with the BIFS node comprising one or more updates based on the raw data to modify the scene, executing the first digital sequence to reflect the one or more updates to modify the scene, and a flag, the status of which enables or prevents the at least one action to be taken into account

On the other hand, Liang discloses one or more updates based on the raw data to modify the scene (column 6, lines 44-60, Liang)², executing the first digital sequence at the terminal to reflect the one or more updates to modify the scene (column 15, lines 47-50, Liang), and a flag, the status of which enables or prevents the at least one action to be taken into account (column 15, lines 33-36 and 47-65, Liang). Kalva and Liang are analogous art because they are from the same field of endeavor of MPEG-4 standards. It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate Liang's teachings into the Kalva system. A skilled artisan would have been motivated to combine as a way of monitoring and controlling the actions which may take place on the device.

² Examiner Notes: Since the BIFS data is a binary format, then the data is clearly "raw" data.

Art Unit: 2161

Regarding Claim 16, the combination of Kalva in view of Liang, disclose the method further comprising transferring said first digital sequence into a composition memory using a decoding sequence of MPEG-4 systems to introduce the interaction data into a composition device for composing said scene (column 4. lines 51-67. Kalva).

Regarding Claim 17, the combination of Kalva in view of Liang, disclose the method wherein transferring is performed under control of a flow comprising at least one flow descriptor, itself transporting information required for configuration of the decoding sequence with an appropriate decoder (column 4, lines 31-37 and 51-67, Kalva).

Regarding Claim 18, the combination of Kalva in view of Liang, disclose the method wherein the BIFS node comprises a number of variable fields dependent on the form of peripheral command device, and transferring the interaction data of fields of the node to fields of objects of said scene is implemented by routes (column 5, lines 46-52 and column 7, lines 41-51, Kalva).

Regarding Claim 19, the combination of Kalva in view of Liang, disclose the method further comprising signalizing activity of the device (column 8, lines 3-4, Kalva).

Art Unit: 2161

Regarding Claim 21, the combination of Kalva in view of Liang, disclose the method wherein signal delivery is performed in the form of a flow indicated by a descriptor, which contains information for configuring a decoding sequence with an appropriate decoder (column 4, lines 61-67 and column 6, lines 5-29, Kalva).

Regarding Claim 22, the combination of Kalva in view of Liang, disclose the method wherein constructing the interaction data sequence is performed in a decoding buffer memory of a multimedia application execution terminal (Fig.2, Kalva).

Regarding Claim 23, the combination of Kalva in view of Liang, disclose the method wherein translation of the interaction data sequence is performed in a decoder equipped with an interface with a composition device for composing said scene similar to an ordinary BIFS decoder for executing the BIFS- Commands decoded on the scene (column 4, lines 51-67 and columns 8-9, lines 60-67 and 1-2, respectively, Kalva).

Regarding Claim 24, the combination of Kalva in view of Liang, disclose the method wherein flow of user interactions passes through a DMIF client associated with the device that generates access units to be placed in a

Art Unit: 2161

decoding buffer memory linked to a corresponding decoder (column 4, lines 51-67, Kalva).

Regarding Claim 25, the combination of Kalva in view of Liang, disclose the method wherein flow of user interactions enters into a corresponding decoder, either directly, or via an associated decoding buffer memory, thereby shortening the path taken by the user interaction flow (Fig.2, Kalva).

Regarding Claim 31, the combination of Kalva in view of Liang, disclose the method wherein the BIFS node further comprises one or more fields that define a type and a number of interaction data to be applied to objects of said scene (column 8, lines 52-57, Kalva).

Regarding Claim 32, the combination of Kalva in view of Liang, disclose the method further comprising: constructing a second digital sequence comprised of at least one action to be applied to said scene and at least one parameter of the at least one action, wherein the parameter comprises a value corresponding to a variable from the peripheral device (column 8, lines 1-21, Kalva)³.

Claims 26-29 have the same subject matter as claims 15-19 and 21-25, and are essentially rejected for the same reasons as discussed above.

Art Unit: 2161

Response to Arguments

Applicant argues, the combination of Kalva, Liang, and Kim fail to disclose "the first digital sequence is based on an interaction stream of raw data from the peripheral command device to the terminal" and "execution of the first digital sequence at the terminal to reflect the one or more updates to modify the scene".

Examiner respectfully disagrees. To begin, Kalva teaches of elementary streams that contain scene description information coded in MPEG-4, wherein the MPEG-4 defines a BIFS (see col.4, lines 17-22 and col.5, lines 15-32), wherein the elementary streams with scene description corresponds to the first digital sequence and the binary format corresponding to the data being raw data. Lastly, Liang teaches about the updating/modifying of a node (col.6, lines 44-60), wherein the MultiUserGroup node is an object based scene description (which is based on the BIFS standard, thereby making the data "raw" data), which allows users to interact with the shared content of the same scene (see col.3, lines 20-30). Also, Liang executes the received modified node (see col.15, lines 47-50). Therefore, the combination of references does in fact teach the above argued features.

³ Examiner Notes: More details about the value being from the peripheral device can be found @ col.7, lines 23-25.

Art Unit: 2161

Points of Contact

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CHELCIE DAYE whose telephone number is (571) 272-3891. The examiner can normally be reached on M-F, 7:00 - 4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Apu Mofiz can be reached on 571-272-4080. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
